Electronic and Air Pollution (Severe)

Not only are we currently polluting the air with particles of contamination from the various industries, we are also contaminating the air with a wide range of electronic pollution that has detrimental affects on our species.

Frequency vibrations can affect all things. Intensity, volume used in conjunction with duration can have very dramatic effects on all things ranging from benevolent to malevolent.

Of particular concern is the frequency range from 87.5 to 108 megahertz (MHz) used by FM (frequency modulation) radio transmission stations. The human will resonate (vibrate) to the half wave from these frequencies based upon the cranial skeleton surrounding our human brain. High volume and long term exposure to these particular frequencies set up vibrations within the human brain that can cause severe health hazards and ultimately induce gradual mental dysfunction and possibly physical deterioration. Taller individuals are more prone to the lower frequency range and shorter individual are more prone to the higher ranges. Music is nothing more than resonate frequencies arranged in a pattern that is "pleasing" to the listener. Music that is pleasing to one can be horrible to another.

Often this is manifested by people say, "I don't like that type of music." Or even, "I hate that type of music." In reality, that individuals internal harmonic structure is of a different vibration that is not in synchronization, and therefore in complete discord with the "music" or vibrational sequence being played. When exposed to other vibrations that are not in synchronization it sets up chaotic eddies that completely disrupt the life patterns of the individual, it is in effect killing them, albeit very slowly, however long term exposure will induce psychosis of the mind and insanity will result. This individual harmonic structure is called a personal keynote; overtones and undertones can be jarring or harmonious to this note. Musicians are well aware of this phenomenon and play music according to the desire to manipulate the mood and emotions of the audience.

Each planet has its own harmonic key, and the basic ultra low frequency (ULF) pulse of Earth is G. Since humans are all currently born on this planet our base vibration is G, thus any deviation frequency from this ULF pulse will either lead to complete bliss or chaos, violence and even death.

The telepathic wavelength is 450 MHz and anything broadcast in this range can have subliminal riders purposefully or unknowingly attached that make the human susceptible to hypnotic suggestions.

Purposefully attached riders are called Radio Hypnotic Intra-cerebral Control (RHIC) mechanisms. By broadcasting in this resonance attaching subliminal riders produces behavioral alterations in the target area according to the rider suggestions. Further, by interfacing this with the known geomagnetic fields of a local area can substantially increase the strength and effects of this.

The riders can range from hyper excitability and violence to intense lethargy and torpor. By attaching riders that peak and valley it can cause insanity to the point of complete mental shutdown. Key words and phrases can be broadcast that make people think subliminal thoughts are their own. A twist on these frequencies is called Electronic Dissolution of Memory (EDOM) riders that manipulate the brain waves to the point that the targets forget what they were instructed to do subliminally after they had done it.

MTBE (ether) is added to the fossil fuel (gasoline) used in combustion engines and comes out the tail pipes of vehicles. Ether creates lethargic behavior in small doses that all industrial nations are continually exposed to; in larger doses it creates an anesthetic sleep or even death.

Burning fossil fuels create several chemical compounds that are deadly, carbon dioxide, carbon monoxide, nitrogen oxides, and sulfur dioxide and lead particulates. When these fuels are not completely burned various other chemicals called volatile organic chemicals (VOCs) also enter the air.

Smog is intense local pollutions often trapped by a thermal inversion and is a generic name applied to all air pollutants in the area. Oxides of nitrogen and VOCs react in the atmosphere to produce photochemical smog. Sulfur dioxide and oxide of nitrogen when mixed with atmospheric moisture turn into pure acid floating within the smog. These chemicals return to the earth as rain or snow, locally or thousands of miles away or anywhere in between. The acid precipitation will burn the leaves of plants and make lakes too acidic to support aquatic and other life. These lakes often supply potable drinking water for humans who then become contaminated as well, leading to cancers and genetic defects.

Ozone is a poison down in the lower atmosphere and is often the base measurement taken to indicate the level of pollution. When the ozone, a form of oxygen gas with three oxygen atoms rather than two, is present, other pollutants including carbon monoxide are usually present at high levels as well. In the upper atmosphere, ozone forms a protective layer that absorbs solar radiation known as ultraviolet-B (UV-B) and UV-B damages deoxyribonucleic acid (DNA).

Chlorofluorocarbons (CFCs), nitrous oxide from fertilizers, methyl bromide a pesticide and other pollutants attack the upper ozone layer allowing more UV-B in, which harms all things on this planet by affecting DNA. Ozone allows gases to vent into space to help cool the planet. Other gases replacing the ozone reflect the greenhouse gases back to the surface of the earth, trapping heat in the earth's atmospheres causing a slow increase of global temperature.

A warmer earth will have more extreme weather with more rain during wet periods, longer droughts, and more powerful storms. It will lead to partially melting the ice caps, leading to a sea level rise. A sea level rise of only 20 inches, will flood coastal cities, force the abandon of low-lying islands and cover coastal wetlands. The temperate zones will shift bringing diseases like malaria to regions hither unknown. Many plant and animal species not easily able to shift territories and habits will become extinct.
